

# Climate and Energy Systems, 2007-2010. Information Management

<http://www.os.is/ces>

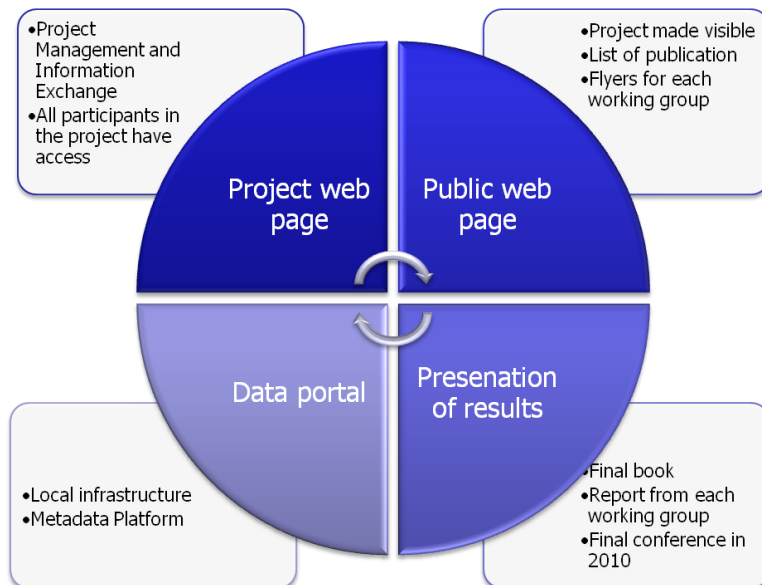

## Main objectives of the Information Management in the CES Project

The Information management group is responsible for information dissemination, active stakeholder involvement and the public outreach. At the national level, CES-national groups will be established to secure national collaboration between the activities.

All participants in the CES project have access to an internal project web-page for information dissemination within the project. The web has been organized with a workspace for each group to communicate and share documents. Every workshop gets its own meeting space with presentations and minutes from the meetings and the steering group uses the web to make core documents available for all participants in the project.

The Project Web has proven to make project management easier:

- All documents are accessible for all participants
- Newest version of the document always secure and shared
- Participants can look up upcoming events, presentations, minutes and announcements
- Saving time for everyone
- 113 registered users on the project web

### Overview of the information in the CES project.

The official web page is available on [www.os.is/ces](http://www.os.is/ces). Results from the project will be presented on the web among a complete list of publications.

A metadata portal has been created on the project web in order to bring together information on data used in the CES project. The metadata platform will contain information on the data used in the CES project, and the data produced in the project.

Some of the working groups will form a cooperation with a GIS working group to create maps and material for the final report.

## Stakeholder involvement

One of the key objectives in the CES project is to establish a structured dialog with stakeholders. The intention is to involve the stakeholders throughout the project and disseminate information. At the national level, CES-national groups have been established to secure national collaboration between the activities. At the CES level the Information management group is responsible for information dissemination, active stakeholder involvement and the public outreach. The key to success is to find the right stakeholders and the right way of disseminating results to them. Of course this also means disseminating the right results, i.e. the results that are meaningful for them.

A Case study on how stakeholders use the results from the CES project will be performed in Finland, Sweden and Iceland.

## Making decisions in a changing world

The project Climate and Energy Systems focuses on renewable energy and how climate change will affect production, construction and investments in the energy companies. Results and data from the working groups can be used to improve the decision making process and a part of the work within information management is to investigate how the process of information dissemination to the energy companies can be improved.

In some cases there is increased inflow in the hydropower plants, the snow storage will increase above certain elevation and spring and autumn floods will change.

## Case Study

Three Case Studies regarding stakeholder involvement will be done in 2009-2010. A case study with the Swedish energy sector aiming at analysing how the Swedish energy sector can use the results from the CES project will be performed by Jenny Gode at IVL.

A case Study with the Icelandic National Power Company on how results from the CES project can be used in the decision making process regarding hydropower production will be performed by Stefania G. Halldórsdóttir at HugurAx.

A similar study with the focus on biomass production will be performed by Kirsti Jylhä at FMI in Finland.

## Presentation of results

Proceedings from the final conference in 2010 will be published. The aim is to get as many stakeholders as possible to contribute to the final conference in Oslo 2010. This will be done through the network of the national Groups.

The working groups are responsible for the flyers and a final report from each working group will be issued in 2010.

A final Book will also appear in 2010 and the proceedings from the final conference in 2010 will be published.
